

Beeswax vs Paraffin

Beeswax

Beeswax is a 100% natural fuel created by bees.

Beeswax candles burn cleaner than any other.

Beeswax candles burn longer than others and do not drip.

Beeswax candles emit bright light that has the same light spectrum as the sun.

Beeswax candles emit negative ions that actually clean the air and invigorate the body.

Beeswax candles are naturally scented by the honey and nectar of flowers packed into the honeycomb within the beehive.

Beeswax candles come from a renewable resource: beeswax

Paraffin

Paraffin is a toxic by-product of the oil industry.

Paraffin candles give off many of the same toxic fumes as are found in auto exhaust.

Paraffin candles are relatively short burning and drip excessively.

Paraffin candles produce a disorganized light spectrum very similar to old-fashioned incandescent bulbs.

Paraffin candles produce toxic petrol-soot that eventually stains all interior surfaces.

Paraffin candles typically contain artificial fragrances and colors which also produce toxins and stains when burned.

Paraffin candles come from a nonrenewable resource that is the cause of most wars these days: petroleum.
